# TITLE OF THE INVENTION

## MAIL OPENER APPARATUS

#### BACKGROUND OF THE INVENTION

This invention relates to mail opener apparatus for use 5 in combination with a postage meter.

Mail opener devices are well known. Generally these devices comprise a cutting device, typically a blade, which is used to slice open a closed mail piece such as an envelope or a small package allowing the contents to be removed. Such cutting devices may be hand operated or driven by mechanical means.

#### SUMMARY OF THE INVENTION

operable to print postal indicia.

- In accordance with the present invention there is provided a mail opener for use with a postage meter; said postage meter including printing means operable to print postal indicia on amil pieces;
- said mail opener comprising a cutting device, the cutting
  device being movable between an operative position to open
  mail pieces and a retracted inopertive position in which
  the cutting device is maintained out of engagement with
  mail pieces; drive means operable to displace the cutting
  device between said operative position and said retracted
  inoperative position, said drive means being operable by
  said postage meter to maintain said cutting device in said
  retracted inoperative position when the printing means is
- Modern postage meters generally comprise a printing module which incorporates a print head for printing indicia such as post marks on mail pieces passed through the meter, and an accounting module which carries out accounting functions in respect of postage values to be applied to the mail pieces. The print head is movable between a printing position and a service position where printing

cannot be effected. In pre-payment meters the print

only enabled to effect printing when the accounting module has effected accounting in respect of the value the post mark desired to be applied. Once the desired postmark has been applied, the print head is returned service position. Other forms of postage meter are different arrangements of printer and known with will share the accounting however, these system, characteristic that printing cannot be effected until accounting has taken place.

It will be understood that only outgoing mail is desirably franked for postage by a postage meter and only incoming is desirably opened by a mail opener. Thus desirable that any mail handling or processing station incorporating both a postage meter and a mail opener constructed and controlled to prevent inadvertent opening or damage to outgoing mail. This can be achieved By providing a of the present invention. means communication between the postage meter and the mail opener, the mail opener can be rendered inactive when postage meter is made active.

The means of communication may be provided in mechanical or electrical form or by the sending of signals such as electromagnetic radiation waves from one device to the other.

Conveniently the devices communicate through mechanical interlocking means being arranged such that movement of the print head of the postage meter into the printing a simultaneous movement of the position causes device of the mail opener into a stowage position. This may be achieved by means of a cam slider arrangement. example, the cutting device may be carried by a which is movable axially in bearings between retracted and operative positions, one end of the shaft in turn a slot on a cam slider. slidable in The cam

5

10

15

turn communicates with the postage meter and is caused to move as the print head moves between its printing and service positions. As the cam slider moves, the shaft carrying the cutting device is engaged in the suitably arranged slot between the operating position and retracted position.

Where the postage meter and mail opener are electrically connected to each other a circuit may be provided which senses or responds to movement of the print head and initiates in response the required movement of the cutting device. Similarly, the cutting device may be controlled by a radiated signal sent by a control system in the postage meter in response to movement of the print head. Thus mail undergoing franking by the postage meter cannot be damaged by the retracted cutting device.

cutting device may be provided in the form of a blade which can be used to slit a seam of the mail piece 20 or the mail piece may be drawn across the blade to edge of the mail piece and allow to the access contents for removal. Preferably, the blade is a arrangement generally such involves less blade, an friction and provides a cleaner cut. Optionally, the mail 25 further comprises means for drawing the mail opener to facilitate opening. Conveniently, these cutter drawing means are provided in the form of a set of The feed rollers may optionally be those already rollers. on the postage meter for ejecting franked mail from the postage meter. Preferably, separate rollers provided on the mail opener, this allows the mail drawn past the cutter at a lower speed than is possible when using the postage meter feed rollers. The position and/or rotating speed of the rollers may be adjustable to 35 suit the characteristics of the package to be opened. For example, at least one of the rollers may be resiliently mounted to allow the rollers to be separated by varying amounts to accommodate different thicknesses of mail.

The mail opener may be configured for attachment to existing postage meters, for example by mechanical fixing to the moving parts of the postage meter. Alternatively, the mail opener may be "built in" to the postage meter during manufacture. The mail opener may share a common power source with the postage meter or may be provided with its own independent power source.

10

Thus it can be seen that the apparatus provides a multifunction mail handling or processing station in compact form with built in safety features.

## 15 BRIEF DESCRIPTION OF THE DRAWING

An embodiment of the invention will now be described by way of example only, with reference to the drawings in which:

20 Figure 1 shows, from a front perspective view, the operating parts of a mail opener according to the present invention controlled by a postage meter,

Figure 2 shows, from a rear perspective view, the operating parts of the mail opener of Figure 1 controlled by the postage meter,

Figure 3 shows from above of the operating parts of the mail opener controlled by a postage meter,

30

Figure 4 shows the mail opener in a housing thereof and having means for attachment to the postage meter; and

Figure 5 shows a mail piece being opened by the mail 35 opener.

## DESCRIPTION OF THE PREFERRED EMBODIMENT

10

30

can be seen from the figures a mail opener generally designated as 1 comprises a rotary blade 2 carried by rotatable shaft 3 which is displaceable along axis C. feed roller 4b and presssure roller 4a are positioned and down stream of the rotary blade for The roller 4b and rotatable shaft mail past the blade. are driven by drive mechanism 5 which briefly comprises drive motor driving an idler shaft and a belt drive from the idler shaft to drive lower roller 4b. The idler shaft also carries a gear which meshes with a gear carried rotatable shaft 3 thereby rotating the cutter blade. The gear carried by the rotatable shaft is maintained in driven engagement with the drive gear by a spring.

A cam slider 6, displacable in the direction of arrow В, 15 comprises a strip of rigid material having an angled cam portion 7 which is inclined to the direction B displacement of the cam slider. The cam portion has slot 8 therein in which a free end of the rotatable 3 is slidably engaged. An end portion 9 of the cam slider 20 6 interrelates with a pair of guides 11 which each have an angled slot 10 in which the end portion 9 is slidable. The pair of guides 11 are fixedly mounted to the print head carrier 12 of a postage meter. The print head 25 12 carries the print head between printing and carrier service positions of the print head.

The print head carrier 12 moves fore and aft along an axis designated by arrow A in figure 1. When printing of indicia is to be effected, the print head carrier 12 moves forward along axis A carrying with it guide pair 11. The mail opener body is fixed in position, relative to the postage meter. The cam slider 6, rotary cutter 2 and its shaft 3 are free to move relative to the body of the mail opener. Movement of the print head carrier of the postage meter forwardly to move the print head from the service position to the operative printing position, causes, due

to engagement of the end portion 9 in the slots 10, movement of the cam slider 6 towards the print head carrier 12 along axis B. Consequent movement of the inclined cam portion 7 of the cam slider 6 draws the rotatable shaft 3 rearwardly in the direction of arrow C and thus the blade, carried by the shaft 3, is moved into a retracted position where it cannot be engaged by mail pieces and hence cannot inadvertently damage outgoing mail that has been passed through the postage meter.

10

25

30

printing of a postage indicium has been completed, the print head carrier is moved rearwardly the direction of arrow A to carry the print head from operative printing position into the service position. this rearward movement of the printhead of carrier, the pair of guides 9 also move rearwardly in direction of arrow A and the engagement of the end portion the cam slider 6 in the slots 10 of the guides causes the cam slider 6 to move, in direction B from left to right as seen in the drawings. The cam portion 7 acts on the end of the rotatable shaft 3 to move the shaft 3 and cutting blade 2 carried thereby in the direction of arrow C whereby the cutting blade is from the inoperative retracted position into operative mail piece opening position.

The mail opener is contained in a housing 13 which carries a protective guard 14 to prevent inadvertent interference and potential injury from the enclosed rollers A mail guide 16 is provided on the mail rotary blade. opener which is aligned with a mail feeding guide on the When a mail piece is fed with an edge postage meter. thereof in engagement with the guide and the rotary cuttr is in the operative mail openeing position as shown 5, the rotary cutter blade 2 extends beyond the edge 17 of the mail piece by a small distance sufficient to cut only the edge 17 from the mail

Consequently contents of the mail piece are not damaged by the action of the cutter blade. When the rotary cutter blade 2 is retracted to the inoperative position by the cam portion 7, the cutter blade is disposed at a position spaced from the edge 17 of the mail piece in which the cutter blade cannot engage the mail piece.

Thus it can be seen that when the print head carrier moves the print head into an operative printing position, the cam portion 7 retracts the cutter blade into inoperative position and when the print head moves the print head into an inoperative printing position the service position, the cam portion 7 moves the cutter blade into the operative position. Thus during franking of outgoing mail the mail opener is rendered inoperative.

As can be seen from Figure 5, a mail piece 15 is fed with an edge 17 thereof just beyond the edge of rotary blade 2 in its operating position. The mail piece 15 is fed by the postage meter under the rotating blade 2 and enters a nip between rotating feed roller 4b and idler roller 4a. The feed rollers 4a and 4b then draw the mail piece 15 past the blade 2 and the opened mail piece 15 is ejected.

25

35

10

15

20

mail piece is guided by mail guide 16 to provide straight cut adjacent to the edge 17 of the mail piece avoid damage to the contents. While the rotary cutter in its operating position as shown in Figure 5, the print head carrier 12 is in its service station position behind the mail quide 16. The dotted line indicates the position printhead carrier when the print head is operative printing position. When the rotary cutter 2 the retracted position, the rotary cutter is disposed behind the surface of the mail guide 16 lie that by the mail pieces so that the rotary cannot engage and damage the outgoing franked mail pieces.

It is to be understood that the foregoing represents just one embodiment of the invention others of which will no doubt appear to the skilled reader without deviation from the true scope of the invention as claimed in the appended claims.
